

# Fix url

## When do I need this feature?

"Help I put the wrong link!"

The common scenario I want to use this feature is the following:

- The message is sent: mailing has been completed
- A wrong link is discovered
- The sender would like to be able to fix the link

Example: I put [www.meilup.com](http://www.meilup.com) but the correct one was [www.mailup.com](http://www.mailup.com)

## How does it work?

Select *Settings > Advanced settings > Developer's corner > Fix URL*.

API keys Codes table Web services Webhooks Troubleshooting Fix URL

Fix an issue with the URL used in a link.

Old URL

New URL

Include parameters you had specified (e.g. Google Analytics)

**ACTIVATE URL REPLACEMENT**

Add the old (wrong) - in this example <http://www.meilup.it> - and the new (correct) URL - <http://www.mailup.it> - and then click on "Activate URL replacement".

A redirect to the new URL is now active.

Remember to use **HTTP://** before the URL.

### Info

- If the "include parameters" option **is checked** then URL like <http://www.meilap.com/welcome.aspx?email=myemail@mailup.com&param1=73&param2=234234> becomes <http://www.mailup.com/welcome.aspx?email=myemail@mailup.com&param1=73&param2=234234>
- If the "include parameters" option **is not checked** then URL like <http://www.meilap.com/welcome.aspx?email=myemail@mailup.com&param1=73&param2=234234> becomes <http://www.mailup.com/welcome.aspx>

## Important notes:

- The algorithm searches for the text in the first text box and replaces it with the text of the second text box
- URLs must be complete with the indication of the protocol (eg <http://www.mailup.it>)
- After clicking the button "**Activate URL replacement**" MailUp checks if the domains are blacklisted by Spamhaus and/or SURBL). The check is done when the URL is saved. There are no periodic checks on the URL specified for replacement
- You can specify up to 60 substitutions

- URL's replacement doesn't last forever. Once the URL is saved it last for 60 days
